

An agent with a key can be talked into anything. An agent with a grant cannot.

Economic authority for autonomous agents, enforced by the network instead of by the software holding the key. Fund it with the stablecoin you already hold.

```
$ warda pay --to kaspatest:qz9x...4m2p --amount 2.5
```

```
x that address is not on this grant's allowlist. There is nothing to sign.
```

Today the limit sits in front of the key. Anything that reaches the agent reaches past it.

TODAY · A POLICY IN FRONT OF A KEY

↳ prompt injection · a bug · a compromised host: each one walks around the check

WARDA · THE LIMIT IS IN THE COIN

The check moved from before the key to inside consensus, the same place an invalid signature is caught. There is nowhere to route around it.

An agent that must ask permission is not autonomous. One that holds a key is not safe.

Every agent that buys compute, data or an API hits this fork. The top two are why agent payments are still demos. **The third is the product.**

The market is not “crypto payments”. It is every company about to give an agent a budget, with nothing but a person to stop it.

Don't give the agent the wallet. Give it permission to spend.

A grant is a coin locked by a script. Its limits are fixed when it is created and checked by every node on every spend, not by us.

CONTROL	EXAMPLE	WHAT IT STOPS
Budget	\$100, held as 2,427 KAS	spending past the total, ever
Per-payment cap	\$5	one large induced payment
Epoch limit	\$20 per hour	a runaway loop draining it in minutes
Payees	an allowlist, fixed at creation	paying whoever the agent is talked into
Term	30 days, as a block height	authority that outlives the job
Revocation	a separate key; the balance goes home	a stuck agent, without trusting the stopper with money

Three powers, held separately, because they are three separate risks.

never receives the balance

Revoking pays the principal, not the revoker. A monitor can be trusted to stop an agent without being trusted with its money, and the script enforces it.

Spending moves the grant. The address is a hash of what is left.

The state (what has been spent, which epoch, how much is reserved) **is the address**. Nothing can raise a budget in place, including whoever issued it: the raised version is a different address holding nothing.

Fund with the stablecoin you hold. Spend under limits the chain enforces.

Converted once, at the edge. Spent many times inside the covenant. Warda holds nothing and takes nothing on the crossing.

Through Igra No custodian. The Hyperlane route into Igra has been paused on chain since 20 Sep; the console re-reads it every hour.	Instant swap ChangeNOW. Custodial for minutes, named and ticked for before anything is sent.	Dymension Validator-multisig bridge. Listed, not yet recommended.
PAUSED	OPEN	EXPERIMENTAL

x402 asks to be paid. A grant proves the buyer is bounded.

THE FLOW

- 1 Agent calls a paid API.
- 2 The API answers **402 Payment Required**.
- 3 The payer checks the grant locally: payee, cap, epoch. A payment it cannot make is never signed.
- 4 The spend is broadcast; **every node checks the same limits again**.
- 5 The seller verifies the proof offline, then serves.

WHAT THE SELLER CAN READ

MAX PER PAYMENT	This payment could not have been larger .
BUDGET LEFT	What this agent can ever spend.
EXPIRES AT	When its authority ends.
AGENT KEY	A stable identity that cannot overspend .
A card payment says “this cleared”. This one carries the buyer’s limits, with nothing of ours in the request path.	

A grant can be handed down, and only ever narrowed.

An agent can hire another agent and pay it from its own budget, without asking the person who funded it, and without being able to hand over more than it holds.

Already on chain. #002 paid #001: the first agent-to-agent payment (fa7ad66b...). #003 delegated #004, allowlist narrowed 2 → 1 (6a534c38...).

A child cannot outlive, outspend or out-reach its parent.

One place to issue, watch and stop agent authority.

- Create

Grants from dollar amounts, in four steps.
- Fund

From USDC or USDT on another chain.
- Monitor

Spend, runway and refusals, from the chain.
- Stop

Revoke, reclaim, renew, find.

Type dollars. The network enforces the limits.

Create a grant

Four steps. You type dollars; what the network compares is the KAS underneath, shown beside every field.

1 Limits

2 Who it may pay

3 Keys and funding

4 Create it

What it may spend

Type dollars. The line under each field is what goes into the script that unlocks the coin, and that is the only figure any node will ever compare.

\$0.0412 per KAS

CoinGecko, read at 10:39 AM — nothing is enforced against it

Total budget — \$

Any single payment — \$

Per hour — \$

Ends in — days

100

20

30

2427.18446602 KAS

121.3592233 KAS

485.4368932 KAS

25,020,000 blocks, at ten a second — then the balance is the principal's to reclaim

The price is only used once.

It turns the dollars you type into the KAS the grant carries, and it is named with a source and a time. After that the grant is KAS: if the price moves, the limits do not, and nothing is ever enforced against a price.

WHAT THE NETWORK WILL ENFORCE

Total it may ever spend

2427.18446602 KAS

Any single payment

121.3592233 KAS

Per hour

485.4368932 KAS

Term

30 days

Who it may pay

— none yet

Sized at \$0.0412 per KAS — the market price, CoinGecko, 10:39 AM. These are KAS figures from here on: if KAS moves, the grant does not. 2427.18446602 KAS stays 2427.18446602 KAS, and what it is worth is somebody else's number.

Not settings

None of the five above can be raised after the grant exists. A grant is not a policy your process agrees to follow; it is a script the network refuses to spend outside of. Changing any of them means issuing a successor and ending this one.

Continue

Create a grant. Budget, cap, per-hour limit and term in dollars; beside each, the KAS every node will compare.

Fund an agent

Four steps. Pay with the stablecoin you already hold; it becomes KAS on Kaspa, and the KAS becomes the agent's spending authority — a budget the network enforces. Warda holds none of it and takes nothing.

✓ You pay

✓ The agent

3 Route

4 Fund it

How it gets there

BASE → CHANGENOW → KASPA L1 → GRANT

Every route this chain has, best first. A route is only as open as its worst step, and the one with no custodian is preferred whenever it is open.

Through Igra

No custodian. Bridge to Igra, swap there, cross to Kaspa L1. Every step is a transaction you sign; nobody holds the money in between.

paused

Instant swap

Custodian: ChangeNOW. Send the stablecoin to ChangeNOW; it sends native KAS to your Kaspa address. ChangeNOW holds the money for the minutes of the swap, and its fee is inside the rate it quotes. Warda takes nothing and never sees it.

open

Dymension bridge

Custodian: a validator multisig (5 of 9). Swap to wrapped KAS, bridge through Dymension's Hub, released as native KAS on L1. The Kaspa leg is tested; every EVM leg is experimental.

experimental

live

Swap the stablecoin for native KAS, delivered to your Kaspa address · ChangeNOW

Custodial for the minutes of the swap: ChangeNOW receives the stablecoin and sends native KAS to your Kaspa address. Its fee is inside the rate it quotes. No 1,000 KAS floor — the minimum is under a dollar. source

Route status checked 2026-09-21.

Back

Continue

Warda's part: none

Warda never holds this money, takes no fee on the crossing, and is not a party to the swap — the venue, the bridge or the swap service is, and each is named above. The day a router holds the float, its security argument becomes a balance sheet.

Already hold KAS?

Then there is nothing to cross. Fund a grant directly from your own wallet.

Create a grant from it →

Fund an agent. Every route's custodian and live status named before anything is sent. Warda's part: none.

Every agent as one fleet. Every grant with its controls.

Showing **Warda's own agents** — published as live examples, not yours.

Connect a wallet to see yours

Fleet

Every agent as one managed system: where the capital sits, who delegated to whom, which ones are close to a limit, and the controls to end, reclaim or renew them — one at a time or together.

AllLiveNeeds attentionEnded

88Agents64 live · 2 ended

WARDA · PRE-SEED · SEPTEMBER 2026

12

Analytics and alerts, derived from the chain.

Analytics

Burn rate, runway against term, cost per task, how close agents run to their caps.

Alerts, run by the server

Budget low, term ending, money arrived, spending spike. Sent to Telegram every 15 minutes.

Accounts

Sign in with MetaMask or a Kaspas wallet. Grants sync across devices; the server follows grants that move.

History

Authority left per grant, hourly, kept for 30 days.

A working system, not a prototype.

12 PACKAGES ON NPM core, chain, x402, provider, registry, router, vendor, verify, agent, CLI, MCP, borsh	840+ TESTS PASSING plus the covenant run through the node's own script engine	5 LIVE SERVICES site and console, MCP endpoint, verifier, registry, a paid demo vendor	6 FLAWS FIXED covenant vulnerabilities, each found by building the attack
---	--	---	--

Listed in the official MCP registry, so an agent framework can discover and use Warda with no custom integration.

We published a working private key and invited people to take the money.

WARDAPROTOCOL.COM/ATTACK · THE STANDING CHALLENGE

grant kaspatest:prw9hklems02v8apxlx5m6y0d90e0j6657ztr3c3cjqlf0wsnwsxz2fs9n0jxr

holds 49.57 KAS · agent secret published in full · anyone may sign

paid 0.33 KAS, all of it to the one vendor it is allowed to pay · 0 KAS anywhere else

Not a hash of it. The complete secret, on a public page, since September. A security claim a reader can falsify in an afternoon beats one they have to accept.

Six agents on chain, paying each other and a stranger.

#001	• SELLER	Reads the Kaspas DAG hourly and sells its digest over HTTP 402.
#002	• REVOKED	Bought from #001: the first agent-to-agent payment. Ended by a key that held none of the money.
#003	• SUCCESSOR	Own key, timelocked grant, two payees. 25 purchases, 21 served . Delegated #004.
#004	• SUB-AGENT	Delegated by #003, not by a person. Allowlist narrowed 2 → 1, then settled home.
#005	• OUTSIDE	Pays demo.kaspa-x402.org , a vendor nobody here controls, on a schedule. Its failures are published beside its purchases.
#006	• BOUGHT	Funded by selling an asset, not from a key that already held KAS.

Honestly: nobody outside this project has used Warda yet. Testnet only, unaudited, no real money invited. Getting the first outside builder is the job this raise starts with.

Three requirements. One chain that had all of them this year.

Warda is the authority model; Kaspa is where consensus can enforce it today. No audited Kaspa covenant exists yet. We asked in the core developer channels; the answer was nobody.

The money and the rails exist. Agents barely use them.

\$303B

stablecoins in circulation; USDT and USDC hold 85%.

Stablecoin Beat • 20 Sep 2026

\$3–5T

of global commerce agents could orchestrate by 2030.

McKinsey • Oct 2025

≤7.5%

of x402 payment value came from autonomous agents, across 199M settlements.

TRM Labs via PYMNTS • 15 Sep 2026

The gap is authority, not rails. Payments for agents already work. What is missing is a limit a company can trust before it lets an agent spend unattended, and that is the layer Warda builds.

Everyone limits agent spending. The question is who can say yes anyway.

APPROACH	WHERE THE LIMIT LIVES	SELLER SEES THE LIMIT
Card controls · Stripe Issuing, Mastercard Agent Pay	the issuer and card network	no
Signed mandates · Google AP2, Visa TAP, Skyfire	an issuer’s signature, checked by the merchant	the mandate
Smart-account permissions · session keys, Permit2	a contract the account owner controls	not by default
Warda grant	L1 consensus; nobody can raise it in place	yes, verifiable offline

These are complements more than rivals: x402 and AP2 carry the request, and a grant is what bounds the buyer behind it.

Enforcement points as described in Eco, “AI Agent Spend Controls” (2026) and each product’s documentation.

Open protocol. Paid console.

The covenant is the commons. A business sits **beside** it, never in front of it: **no percentage of any payment, ever**. Warda is not in the payment path.

Free, always

Protocol, SDK, CLI, MCP server, verifier, registry listing. Everything in the browser console.

Console Pro · Team

\$29 and \$199 a month. Synced grants, server-run alerts, following grants that move, history, several wallets per team. Card billing is built; switched on after mainnet.

Next

Hosted verification for merchants and auditors. Ranking from on-chain payment history. Enterprise fleets: roles and policy templates.

Nothing has been charged yet. Every account is on a free beta until mainnet; pricing and the first design partner are what this raise settles.

From a working testnet to money strangers trust.

NOW • BUILT

Agent payments on testnet

- Grants, delegation, revocation
- x402 payer and provider
- Verifier, registry, MCP
- Console with accounts and alerts
- Funding from USDC and USDT

NEXT • THIS RAISE

Mainnet, audited

- Independent covenant audit
- Mainnet, principal key offline
- First outside services and agents
- Paid plans switched on

LATER

The agent economy

- Stablecoins held in the grant, once Kaspa has them natively
- Seller-side conversion, when sellers ask
- Enterprise fleets: roles and policy templates
- The authority model on other settlement layers

One person, six months, in public.

ARTY · FOUNDER · AJ@WARDAPROTOCOL.COM · TELEGRAM [@WARDA_PROTOCOL](https://t.me/@WARDA_PROTOCOL) · X [@WARDA_PROTOCOL](https://x.com/@WARDA_PROTOCOL)

Solo founder. That is a risk, and it is also the reason there is this much working code and this little marketing. Background in product and project management across crypto, DeFi, fintech and banking.

Built, not researched

Twelve packages, five live services, an MCP listing, a console with accounts, six agents on chain.

Deep in an unexplored surface

Six covenant vulnerabilities found and written up. Known because they were broken, not read about.

Everything is written down

Including the failures: the key lost to terminal scrollback, the payment that settled and was never delivered.

\$700–900k pre-seed, on a SAFE, for 18–24 months.

~35% · SECURITY	The first independent review of a Kaspas covenant. The gate before real money.
~35% · ENGINEERING	Two hires. Mainnet hardening, offline key custody, the console’s team features. The end of the one-person bus factor.
~20% · ECOSYSTEM	Services listed, agents paying, and grants to the first builders who ship on it.
~10% · RUNWAY	Infrastructure, legal, and the buffer to fix an audit finding properly.

Audited
A published review of the covenant, findings and all.

On mainnet
Real value under real limits.

Used by strangers
Services and agents we did not build.

Give agents money. Not unlimited authority.
